Automotive data capabilities

auto.dev and mcp.vin | Scope of available data and developer access

auto.dev entries reflect its public product descriptions. mcp.vin entries reflect the verified release 1.6.0. This is a scope comparison, not a test of relative accuracy, coverage or service performance.

Capability	auto.dev advertises [1]	mcp.vin implementation [2]
VIN decoding	Global VIN decode	**Partial.** NHTSA vPIC decoding and validation; US-oriented coverage.
Specifications	VIN-based specifications	**Partial.** vPIC fields, EPA configurations and Canadian dimensions.
Factory equipment	OEM build data	**Gap.** Exact factory options, paint and option pricing are not verified.
Plate lookup	Plate-to-VIN	**Gap.** No verified free nationwide source integrated.
Inventory	Vehicle listings	**Gap.** No nationwide inventory feed integrated.
Photography	Vehicle photos	**Partial.** Representative stock images; no exact-VIN photo coverage.
Interest rates	APR endpoint	**Partial.** Dated Federal Reserve benchmark; no personalized quote.
Loan payments	Payment calculations	**Partial.** Amortization from entered APR, taxes, fees and term.
Taxes and fees	Tax and fee endpoint	**Gap.** Entered amounts only; no jurisdiction-specific lookup.
Ownership costs	Ownership-cost endpoint	**Partial.** Editable cost scenarios; no resale or repair-cost prediction.
Recall campaigns	Recall endpoint	**Partial.** Model-year NHTSA campaigns; VIN applicability unconfirmed.
Unrepaired recalls	Open-recall endpoint	**Partial.** Ford, GM and Tesla status; Honda active recalls; Nissan/Mopar positive open records. Toyota, Hyundai, Kia: interactive checks.
Developer access	REST, MCP, CLI, SDK	**Implemented.** REST, 22 MCP tools, local JavaScript client and CLI.

Assessment: mcp.vin supports public-data research and transparent cost modeling. It does not yet replace auto.dev across factory build data, inventory, plate lookup or universal VIN recall repair status.

[1] auto.dev product catalog: www.auto.dev; specifications, OEM build and open-recall product pages. Reviewed 24 Oct 2026. Advertised capabilities were not independently benchmarked.
[2] Source: release 1.6.0; source review dated 24 Oct 2026. Partial = narrower scope. Gap = required data not integrated. Implemented does not imply identical data coverage.

Data sources and methodology

mcp.vin | Evidence, coverage and appropriate use

Primary source	Implemented use	Interpretation
NHTSA vPIC [1]	VIN decoding and submitted vehicle attributes	US-oriented manufacturer records; completeness varies by vehicle.
EPA / FuelEconomy.gov [2]	Configurations, emissions, energy assumptions and owner MPG	Test configuration data. Owner reports are voluntary; sample size and method are shown.
Transport Canada via vPIC [1]	Dimensions and curb mass	Canadian model variants. Select the appropriate configuration; not an exact-VIN match.
NHTSA ODI archives [3]	Manufacturer communications and defect investigations	Dated local indexes. Report variants and provenance retained; not a vehicle-level defect finding.
Federal Reserve G.19 [4]	New-car loan rate context	Manual snapshot: Aug 2026 observations, released 7 Oct 2026. Not a lender offer.

Verified implementation

101 Node tests and two index integrity tests passed. Live checks exercised REST, the JavaScript client and MCP. The interface was reviewed on desktop and at 390-pixel width. This is implementation verification, not an independent accuracy certification. Investigation index: **5,351 distinct actions** across 154,439 association rows. The manufacturer-communications index contains 5,834,958 vehicle/component associations across seven archives; that is not a count of unique bulletins.

Illustrative source check

2003 Honda Accord V6 automatic, EPA ID 18657: **22 combined EPA MPG**; **23.5 owner-reported harmonic mean MPG** from 29 submitted records, range 15-34 MPG. These measures use different methods and samples. The Honda Accord 2003 investigation query returned five distinct actions. Values reflect the 24 Oct 2026 UTC verification.

Professional use

Confirm the configuration. Model-year records do not establish exact factory equipment.
Read manufacturer coverage. Ford, GM and Tesla report VIN status; Honda reports active recalls (15 years). Nissan and Mopar supply positive open records. Toyota, Hyundai and Kia need interactive verification. GM closure is not always repair; only explicit repair dates are shown.
Review assumptions and dates. Cost results use entered assumptions; snapshots can become outdated.
